

Experienced PHP developer required for Translation database development

We are looking for an experienced PHP developer for a 3–6-month project. This project requires a full-stack software developer working as a single developer for the project. The project includes several sub-projects or project phases. Must be experienced with the LAMP software stack (Linux, Apache, MySQL, PHP, and additionally Javascript, HTML, CSS, and Bootstrap). We have detailed project specifications available for applicants to review upon request.

The purpose of the project is:

- To provide an online database (a web application) accessible to all FPMT translators of all languages
- To serve as a database for translations into all languages
- To promote and facilitate the standardization of translation, phonetics, and transliteration of mantras in all languages

Requirements

- Experience in making database architecture recommendations.
- Experience as full stack developer working with the LAMP software stack (Linux, Apache, MySQL, PHP, and additionally Javascript, HTML, CSS, and Bootstrap)
- Have successfully completed similar projects is required.
- PHP and Javascript for the back-end, as well as experience with MySQL and configuration of the technology stack on a (Debian) Linux server are also necessary.
- A virtual environment will be necessary to develop the web application and access to the server will be necessary to push changes in production.
- The web application also requires some design skills while working on the front-end side of the project.
- Familiarity with Tibetan language is recommended but not necessary.

To be a best fit for this project you need:

- Ability to communicate clearly.
- Dedication to meet project deadlines in a timely manner.
- Attention to details.
- Due to possible time zone conflicts, we may just have a few hours a day to meet whenever necessary.

If you are interested in this project, please reply with your availability to alfredo@fpmt.org
